SPRING REMINDERS (Cont'd from page 22)

Now as to plant feeding. There are more ideas about this than you have fingers and toes so the field is wide open. It is a good idea a few weeks before you start your work to take a cup full of soil from each location of your planting for analysis. Mark spots and bags for identification. The samples should be taken at least 6" below the surface. Take them to your local County Agent with the request that they be sent to Gainesville for a complete analysis. On return of the cards you will have a proper picture of what to do.

The desired soil analysis is as follows:

pH between 5½ to 6½	Phosphorus 100# per acre
Calcium 2,000# per acre	Potassium 200# per acre
Magnesium 500# per acre	Nitrogen Low

Soluble salts below 500 parts per million.

Since the cards are returned with the figures based on per acre it is easy to plan your feeding.
